Dashboard documentation

Integrated workforce monitoring

Prepared by John · 30 September 2026 · Accompanies the executive brief

1. Purpose and design principles

This dashboard tells the Chief People Officer, the Chief Technology Officer, the CFO, and the Board Compensation Committee whether NovaTech has the workforce to execute the FY2024–FY2026 plan. It supports five decisions due in the next 90 days: reskilling investment, hire versus develop versus automate, retention for high-risk roles, integration of the acquired teams, and the FY2025 workforce targets. The monitoring horizon is the FY2023 baseline, reviewed monthly for red departments and quarterly at the board, through Q4 FY2025.

Principle	How it shaped the view
Clarity	One question per view. Sorted bars, direct labels, a benchmark line, and no dual axis. A reader should see the breach without a legend hunt.
Decision relevance	Every metric maps to a decision in the scenario brief. Departments inside benchmark on attrition and engagement (Finance, Legal, Marketing) stay in the data and off the action list.
Integration	All four views use the same department names and the same FY2023 headcount, joined from seven workbook tabs. A red department shows up on attrition, skills, and engagement together.
Hierarchy	The five figures at the top state the answer. The charts explain it. The role view says what to do.

2. Data brought into one department list

Tab	What was taken	Where it shows up	Quality note
Headcount	3,666 people by department, region, full-time mix, tenure, manager span	Common denominator for every rate	File total is 3,666, not the stated 4,200
Attrition	FY2022 and FY2023 exits, average headcount, exit reason, risk flag	Attrition view and the $44.2 million cost	Annual totals. The README says monthly. CloudOps is unflagged at 14.1%
Tenure	Headcount by tenure band	Experience risk, especially acquired teams	Tab totals 3,661. IT is 115 here and 120 on headcount
Skills	AI-skill coverage, department target, people to train, enrollment	Readiness view	Skill flag is binary. No proficiency level
AI role exposure	Exposure, augmentation, strategic importance, action	Role view. 15 roles, 1,258 people	Not a census of all jobs
Compensation	Band midpoint, actual pay, replacement cost, at-market flag	Retention cost versus replacement cost	No headcount by level, so the cost is a mix assumption
Engagement	Quarterly score, eNPS, top concern, participation, action-plan status	Health view and early warnings	Department scores, not person-level. One eNPS point, Q4 only

Join key is department name, after dropping total rows. Rates in the file are stored as decimals and were not recalculated, except company attrition (493 exits ÷ 3,566 average headcount = 13.8%) and the headcount-weighted engagement and eNPS. The role priority score matches 0.4 × automation exposure + 0.3 × augmentation potential + 0.3 × strategic importance on every assessed role. Engineering replacement cost weights the published costs 30% junior, 30% mid-level, 25% senior, 10% staff, and 5% manager. Data-science cost weights analyst, ML engineer, and data engineer replacement costs by current headcount. Data engineers use the senior data scientist replacement cost because the file has no data-engineer band.

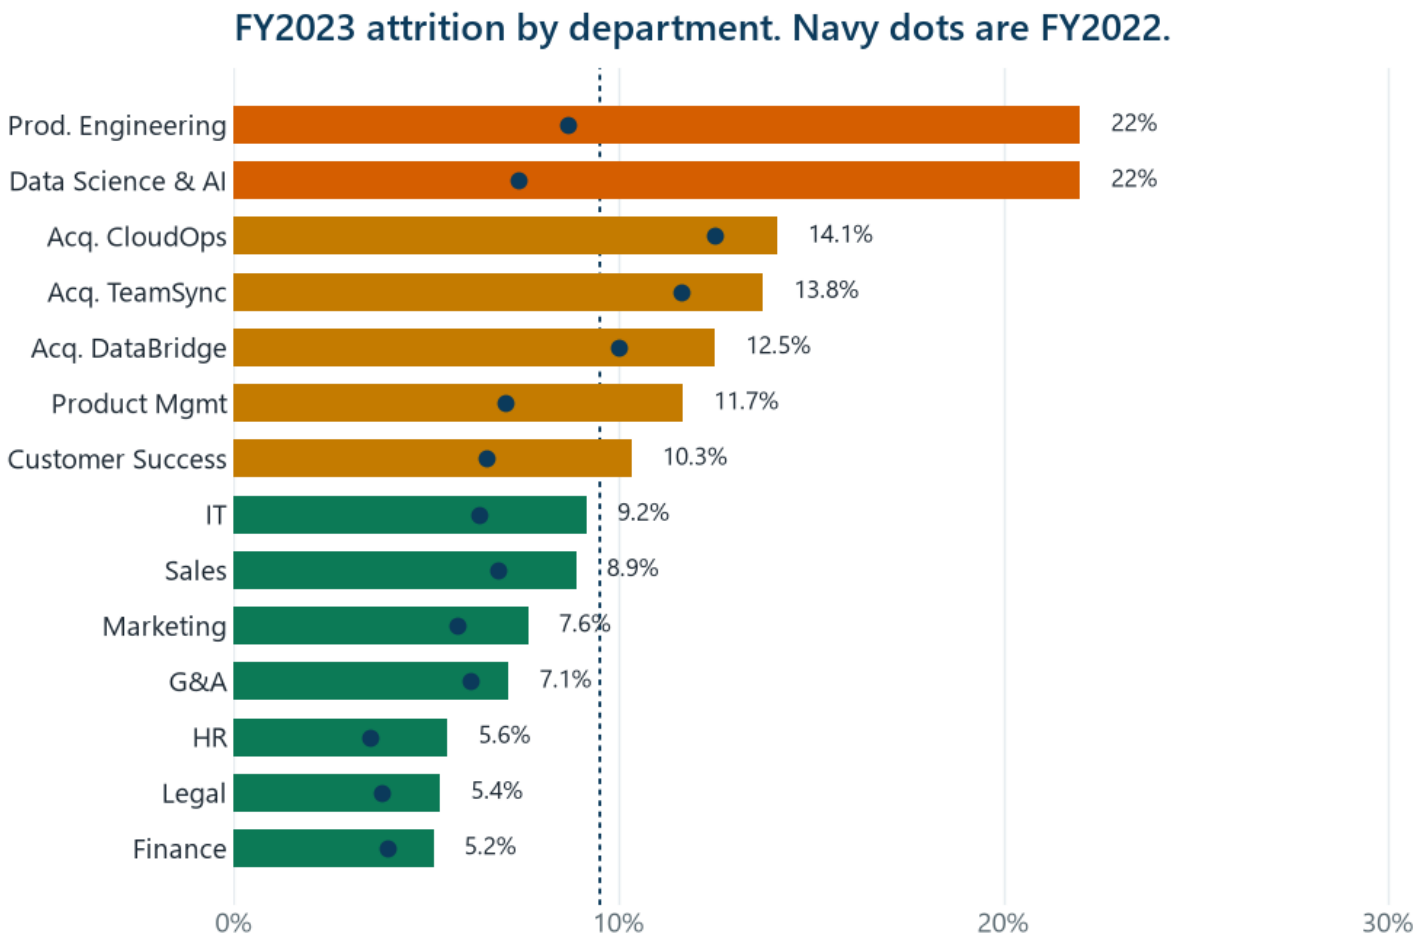

3. Why these four metrics

Metric	Measures	Why NovaTech	Does not capture	Threshold	Chart and why

Attrition rate	Exits ÷ average headcount, by department, FY2022 and FY2023 Source: Attrition tab. It is the failure mode in the two functions the roadmap depends on, and it prices the CFO's question.	Performance rating of leavers, regrettable versus non-regrettable, and any month inside the year.	Above 15% in engineering or data science; above 12% in any department.	Horizontal bar, colored by breach, with an FY2022 dot and a 9.5% line	A bar against a line is faster to read than a table of rates. The dot shows the jump without a second set of bars.
AI-skill coverage	Share of employees with an AI-adjacent skill, versus the department FY2025 target, plus enrollment Source: Skills tab. The 65% company target cannot be managed as one number. Engineering's 380-person gap and DataBridge's 54-point gap need different owners.	Skill depth, completion of a course, or whether the skill is used on the job.	Off the path to 45% company coverage by Q4 FY2024 and 65% by Q4 FY2025. Quarterly floor: 100 new learners.	Horizontal bar of coverage with a tick at the target	The tick shows distance to the goal. The label shows how many people that distance represents.
Engagement and eNPS	Quarterly engagement by department and Q4 eNPS, rolled up by headcount Source: Engagement tab. They move before attrition. Engineering fell 10 points and DataBridge's eNPS is −32, with no action plan.	Driver scores under the top concern, and eNPS for Q1–Q3. Participation is 75–95%, lowest in acquired teams.	Engagement under 60, or down 3 points in a quarter. eNPS still negative.	Lines for the path, bars for eNPS, healthy band shaded +10 to +30	The line shows direction. The bar shows who is outside the healthy range right now.
Role action	Headcount by automate, augment, or expand, from the file's classification Source: Role exposure tab. It answers hire, develop, or absorb. Treating all 15 roles as one reskilling program would miss both the underhired AI product managers and the roles that should not be backfilled.	Tasks inside the role, timeline of automation, and the other two-thirds of employees who were not assessed.	QA hybrid completion under 80% by Q4 FY2025, or AI product manager headcount still at 35.	Bars sized by headcount and colored by the file's action	Color carries the decision. Length carries the number of people affected.

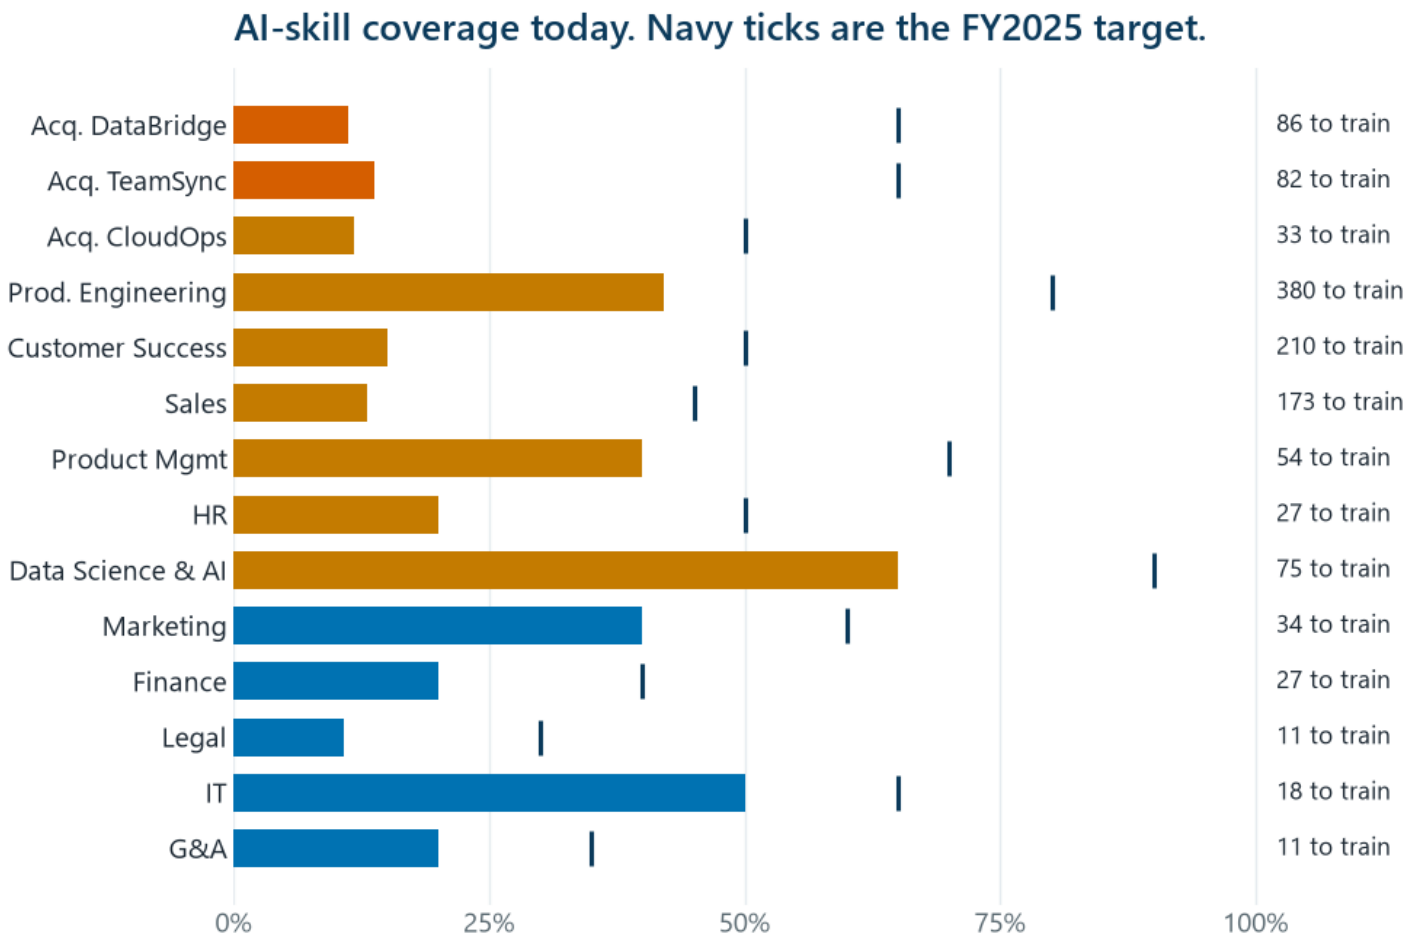

4. Annotated views

Panel 1: vermillion is attrition at or above 15%, amber is above the 9.5% benchmark, and the navy dot is FY2022. CloudOps is amber even though the file does not flag it. Panel 2: bar length is coverage today, the tick is the FY2025 target, and the number is people still to train. Panel 3: the company line falls from 70 to 63; DataBridge is the bottom line. Panel 4: 215 to reskill or absorb, 743 to upskill and protect, 300 to hire. Full-size charts are on the Dashboard sheet of the workbook.

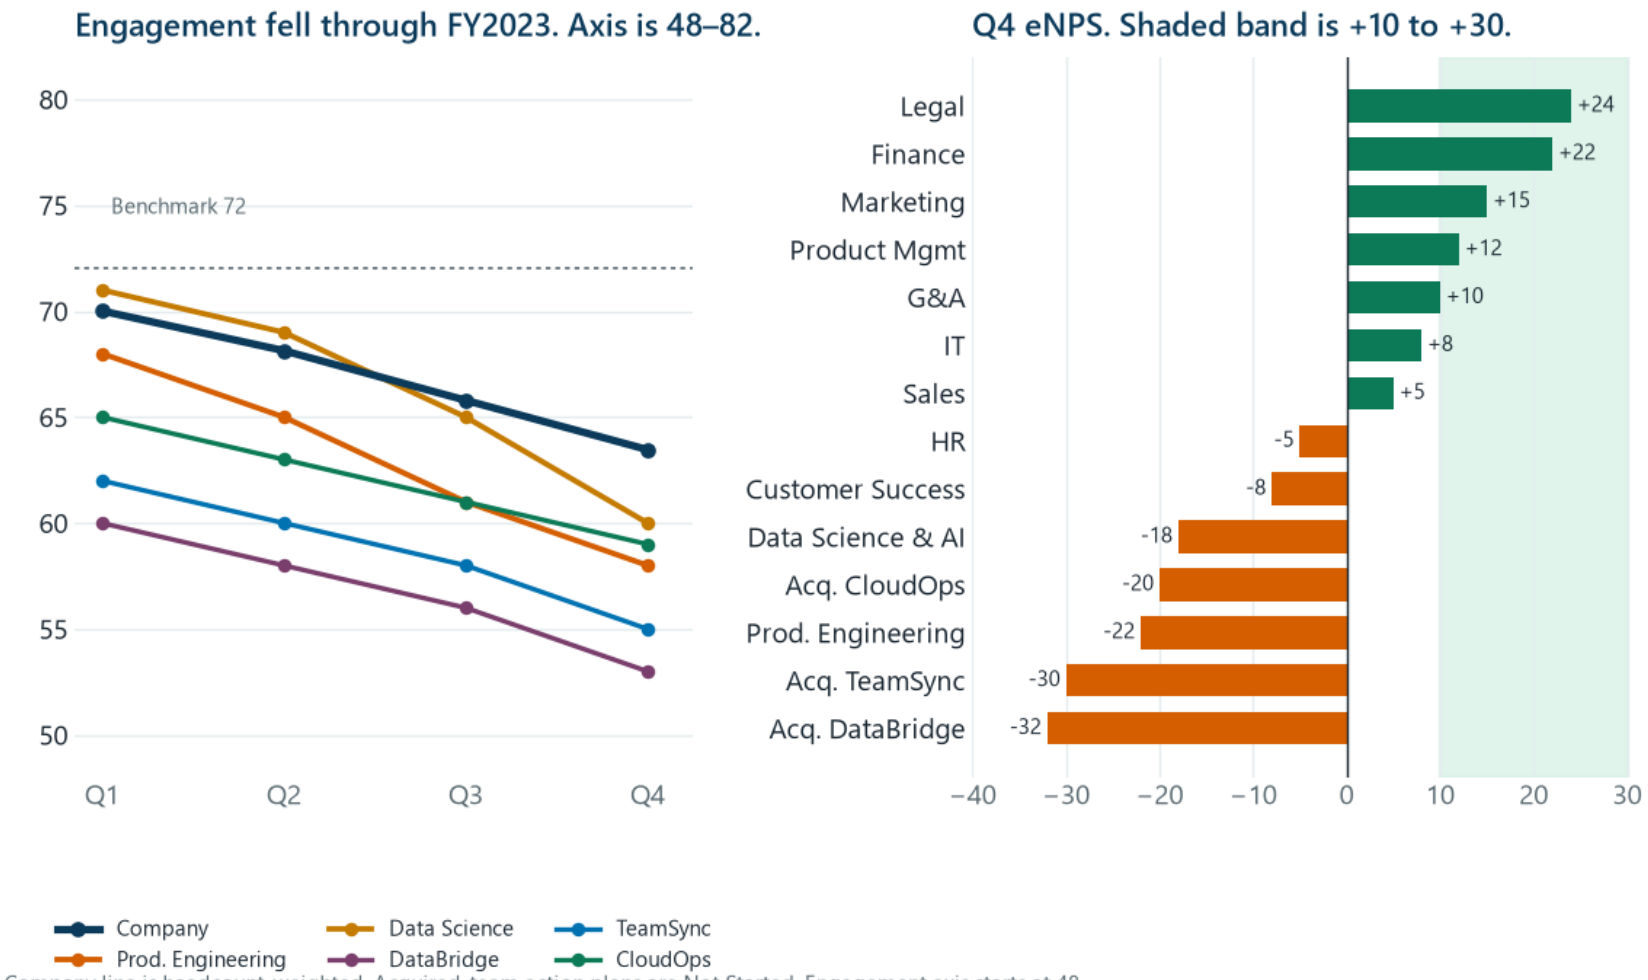

Dashed line: 9.5% benchmark. Review above 15% in engineering or data science, and above 12% in any department.

Attrition risk. Vermillion is at or above 15%. Amber is above the 9.5% benchmark and below 15%. Green is inside the benchmark. Navy dots are FY2022. CloudOps is amber even though the file does not flag it high risk.

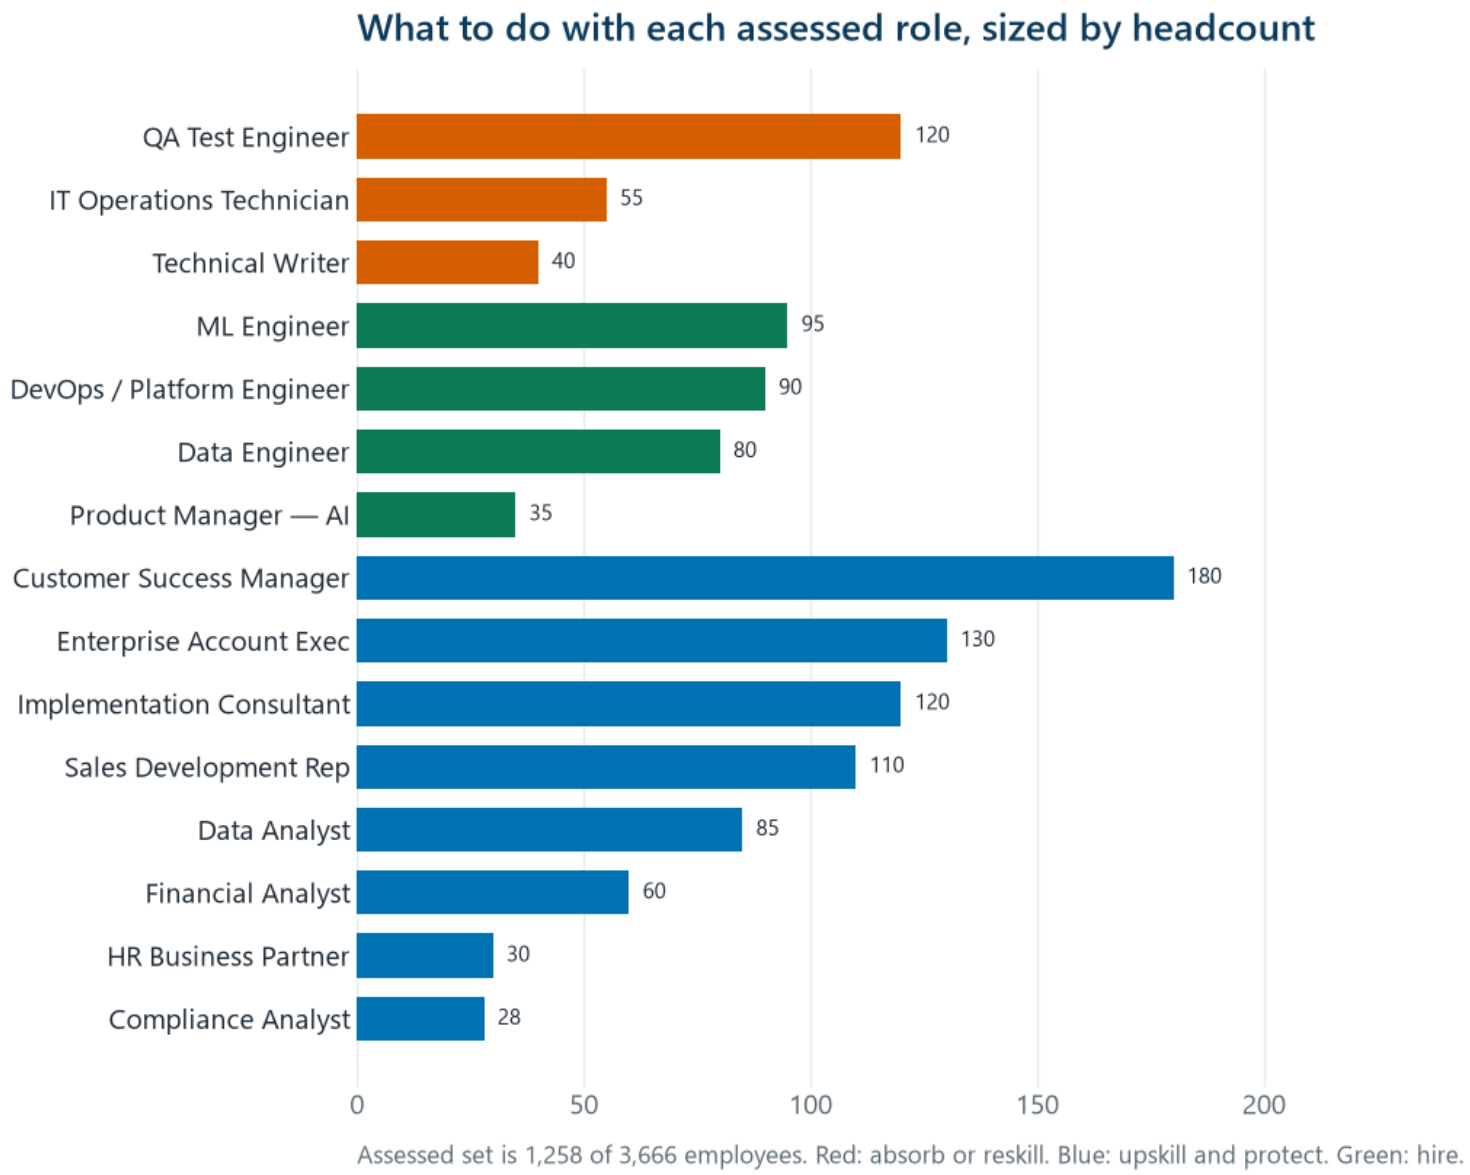

1,221 employees to reskill. 198 enrolled (16%). Red: 40+ points short of target. Amber: 25+ points.

AI readiness. Bar length is coverage today. The navy tick is the FY2025 target. The label is people still to train. Engineering is the volume problem (380). DataBridge and TeamSync are the rate problem (54 and 51 points) and have almost no one enrolled.

Workforce health. The company line falls from 70 to 63. The shaded band on eNPS is the healthy range, +10 to +30. Acquired teams and the two roadmap functions sit left of zero, and their action plans are Not Started.

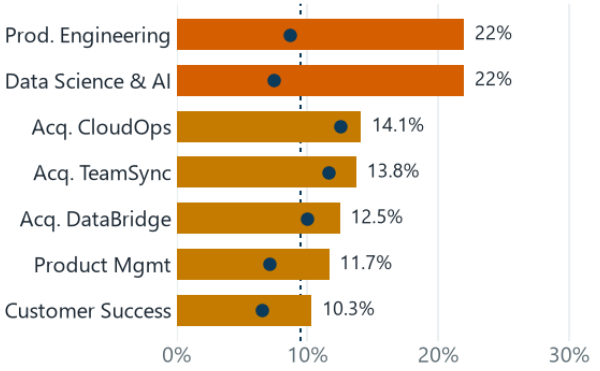

Role action. Red means absorb the vacancy or reskill. Green means hire. Blue means upskill and protect. This set is 1,258 of 3,666 employees, about one-third of the file.

NovaTech does not yet have the workforce for its three-year AI plan

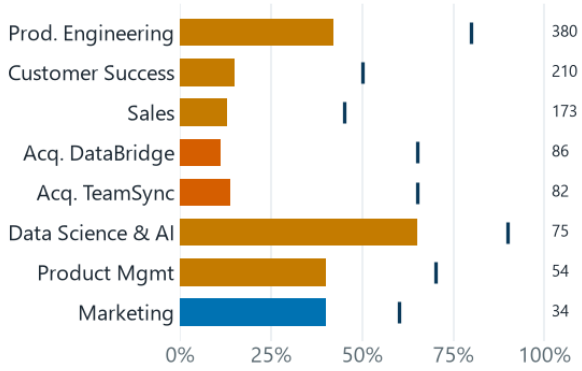

Data as of 31 Dec 2023 · 3,666 employees in the planning file, against 4,200 stated · Dot on attrition = FY2022 · Tick on skills = target

13.8%	22%	29.7%	-8	$44.2M
Company attrition	Eng. and data science	AI-skill coverage	Weighted eNPS	Eng. + data science
Benchmark 9.5%	Up 13 points in a year	Target 65% by Q4 FY2025	Healthy range +10 to +30	FY2023 replacement cost

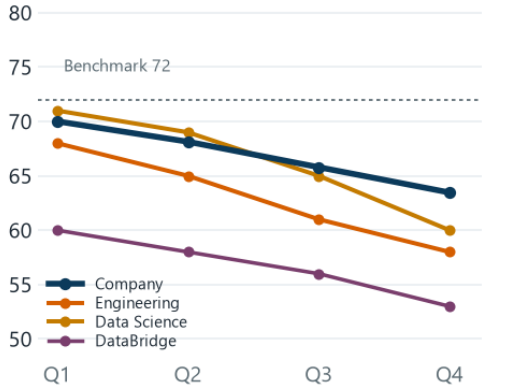

1 Attrition — above the 9.5% benchmark

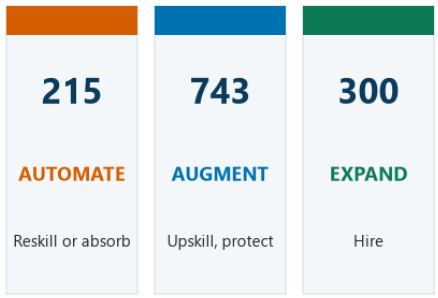

2 AI readiness — largest training counts

3 Workforce health — quarterly engagement

4 Role action — 1,258 employees assessed

5. Limits, assumptions, and the next build

Limits. The workbook is short 534 people versus the stated company, and short about 495 acquired employees versus the narrative of 900. Until Workday is reconciled, FY2025 targets set from this file will be wrong. Leaver level and performance are missing, so the $44.2 million figure is a planning estimate. The skill field does not say whether someone can do the work or only completed a tag. eNPS exists for one quarter.

Assumptions. High automation exposure means a score of 4 or 5. Company health is the headcount-weighted average of department scores. CloudOps is treated as high risk because its attrition is 14.1%, regardless of the flag. Bands marked “N” in the compensation tab are the retention population.

Next build, in this order. First, a monthly exit feed so the board can see a rolling six-month rate; the README promises it and the sheet does not contain it. Second, leaver level and a regrettable-loss flag, so replacement cost becomes an actual instead of a mix. Third, a skills record tied to Cornerstone completion and to the role profile, so coverage is more than a yes or no.

Working notes used to reach these views

Current state. Headcount strain is not spread evenly. Engineering and data science produced 264 of 493 exits. Acquired tenure is 1.1 to 1.4 years, and 70% of that cohort is inside year one. Engagement action plans are In Progress for the roadmap functions and Not Started for every acquired team. Finance, Legal, and Marketing do not need this round of investment.

AI notes. Automate: QA test engineer (120, reskill), technical writer (40, reduce), IT operations technician (55, reskill or reduce). Augment: data analyst (85), sales development rep (110), customer success manager (180, protect), financial analyst (60), HR business partner (30), compliance analyst (28), implementation consultant (120), enterprise account executive (130, protect). Expand: ML engineer (95), AI product manager (35), platform engineer (90), data engineer (80). The composite score rewards strategic importance, so a protected role can outrank a role that will be automated. The classification column, not the composite alone, drives the action.
